

RESEARCH PAPER 00/29
15 MARCH 2000

Unemployment by Constituency: Revised rates

The House of Commons Library has revised its methodology for calculating unemployment rates for constituencies. This paper describes the change and shows the effect of using the updated methodology on the residence-based unemployment rates for each constituency as at January 2000.

Library Research Papers are compiled for the benefit of Members of Parliament and their personal staff. Authors are available to discuss the contents of these papers with Members and their staff but cannot advise members of the general public. Any comments on Research papers should be sent to the Research Publications Officer, Room 407, 1 Derby Gate, London, SW1A 2DG or e-mailed to PAPERS@parliament.uk.

Summary of main points

The House of Commons Library has, for several years, published unemployment rates for each parliamentary constituency. For the last few years, the denominator used in the calculation of the rate has been the number of economically active people living in each constituency in 1991.

This paper describes why it has been necessary to update the denominators and how this has been done. The table shows the effect of updating the denominators on the unemployment rates for each constituency.

The average impact is to reduce the unemployment rate by 0.2 percentage points. For most constituencies the effect on the overall unemployment rate is small. The majority of constituencies show a change (irrespective of sign) of under 0.5 percentage points. However, around one in ten constituencies show a larger change.

I Introduction

For several years, the unemployment rates in the Library's monthly *Unemployment by Constituency* Research Paper¹ have been calculated by dividing the number of unemployed claimants from the monthly count by figures for the number of people economically active derived from the 1991 Census of Population. For a full exposition of the methodology, see Research Paper 96/63, *New Unemployment Rates for Parliamentary Constituencies*.

These Census denominators are now rather out-of-date. To the extent that the economically active population resident in a particular constituency has grown since 1991, the unemployment rates have over-estimated the true rate. Likewise, where the economically population has declined since 1991, the Library's rates will have under-estimated the true rate of unemployment. However, in most cases any error is likely to have been small. For example, if a constituency has an unemployment rate of 5% and the denominator is 10% below the actual economically active population, the estimated unemployment rate will only be 0.5 percentage points too high.

The Library has decided to employ more up-to-date denominators, which relate to 1997, in the calculation of the rates for February 2000 onwards.² This paper describes the how the denominators have been updated. The tables on pages 10 (listed alphabetically) and 23 (sorted by change in overall rate) show the effect of updating the denominators on the unemployment rates for each constituency.

These residence-based rates (on both the old and new methodology) should be regarded more as a social measure of relative deprivation than as an economic measure of the mismatch between the supply of and demand for labour, as they take no account of people's ability to seek work outside the constituency in which they live.

It should be noted that the official national and regional headline unemployment rates are now based on the International Labour Organisation (ILO) definition of unemployment. Figures for constituencies are, however, not routinely available on this basis. Since 16 June 1999, however, the ONS has published official unemployment rates for all constituencies, based on the number of claimants of unemployment-related benefits.

The difference between the Library's rates for constituencies and the official unemployment rates lies in the denominator used. As stated above, the House of Commons Library rates express the number of claimants resident in each constituency as a percentage of the economically active population resident in each constituency. In contrast, the ONS unemployment rates express the number of claimants resident in a constituency as a percentage of the 1998 workforce (the number of jobs in the constituency, regardless of whether the jobholders are resident or not).³ Thus the official rates tend to be biased down in areas of net inward commuting and vice versa.

¹ The most recent example is *Unemployment by Constituency, January 2000*, Research Paper 00/19

² As shown in *Unemployment by Constituency, February 2000*, Research Paper 00/28

³ Under the definitions used for calculating the workforce, a person who has two part-time jobs counts twice.

II Basis for denominators

A. Great Britain

The Library commissioned CACI Ltd to produce estimates of the economically active population in each constituency in Great Britain in 1997. They did this by carrying out the following three-stage exercise:

- **Stage 1:** Economic activity rates for each ward, for males and females separately, broken down into nine age bands, were derived from the 1991 Census.
- **Stage 2:** The resulting 18 rates for each ward were then applied to CACI's estimates of the size of the relevant subsets of the population in each ward in 1997.
- **Stage 3:** The resulting figures were then totalled and constrained at parliamentary constituency level using data from the Labour Force Survey.

B. Northern Ireland

CACI were unable to provide similar information for constituencies in Northern Ireland. In the absence of a better solution, revised denominators were estimated by the House of Commons Library using the following two-stage exercise:

- **Stage 1:** The existing denominators were decomposed into 14 age and sex groups for each constituency. Then, based on data from the Labour Force Survey, each group was adjusted to reflect the change between 1991 and 1997 in the appropriate economically active population for Northern Ireland as a whole. The groups were then re-aggregated to form new denominators.
- **Stage 2:** Approximate population estimates for 1991 and 1997 were compiled for each constituency based on official mid-year estimates at local authority district level. Where districts cross constituency boundaries, the population was simply allocated on the basis of the number of wards in each constituency. The denominators derived from stage 1 were then adjusted up if the estimated population had grown faster than the Northern Ireland average and vice versa.

Whilst it is possible that the two stages overlap to some extent, applying them both reflects the view that it is changes in population rather than in economic activity rates which have been the main driver in the changes in the size of the economically active population since 1991. While it is recognised that this process is imperfect, it should remove systematic bias between Northern Ireland constituencies and the remainder of the United Kingdom and pick-up the main population shifts within Northern Ireland.

III Results

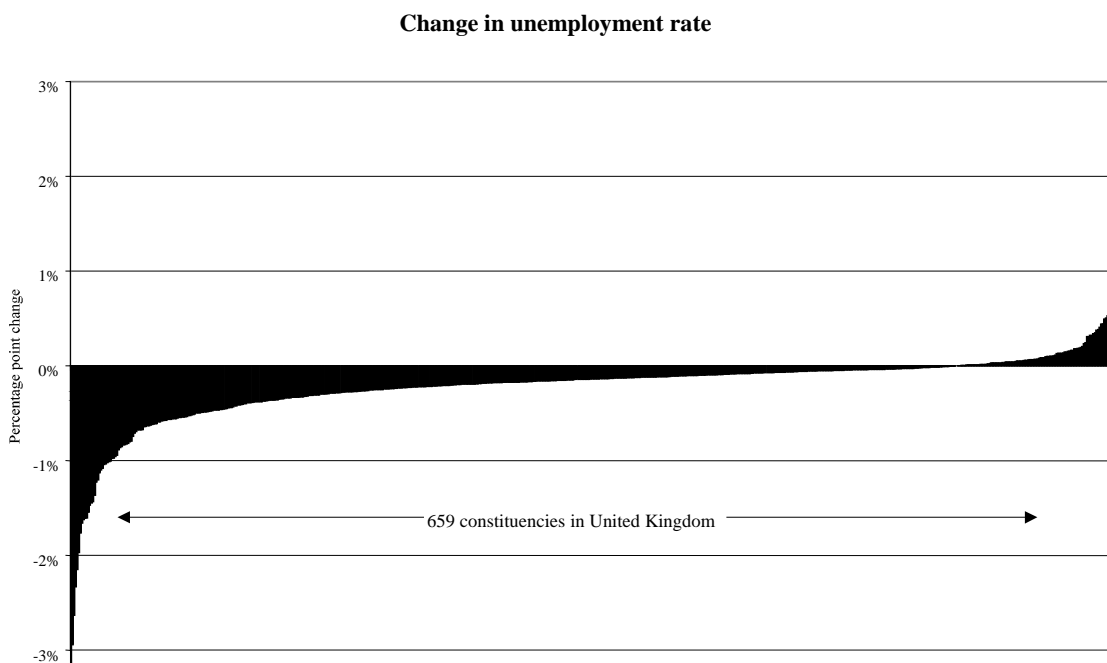

The tables on pages 10 (listed alphabetically) and 23 (sorted by change in overall rate) compare the residence-based unemployment rates for January 2000 using the 1991 and 1997 economically active populations as denominators. It also shows the differences between the two rates, measured in percentage points.

Given that the number of unemployed claimants (the numerator) is constant, a change in a rate can be due only to a change in the denominator. This means that an increase in a rate is due only to a decrease in the size of the economically active population, and vice versa.

Nationally, the total rate has dropped by 0.2 percentage points. This is consistent with the increase overall in the economically active population of the UK between 1991 and 1997. This can be broken down into a 0.4 percentage point decrease for males and one of 0.1 percentage points for females, showing that between 1991 and 1997 the economically active male population has increased at a higher rate than that for females.

For 632 of the 659 constituencies in the UK, the total change in the rate is no more than one percentage point. Only one constituency (Glasgow Pollok) faces an increase in its rate of more than one percentage point, whilst twenty-one constituencies undergo a decrease of more than one percentage point, with the biggest decrease being one of 3.2 percentage points (Glasgow Shettleston). In general, these figures tie in with what might be expected from knowledge of the areas involved, with the largest decreases in the rate being associated with constituencies known to have undergone an increase in economic activity.

The following chart illustrates the distribution of changes in the overall rates.
